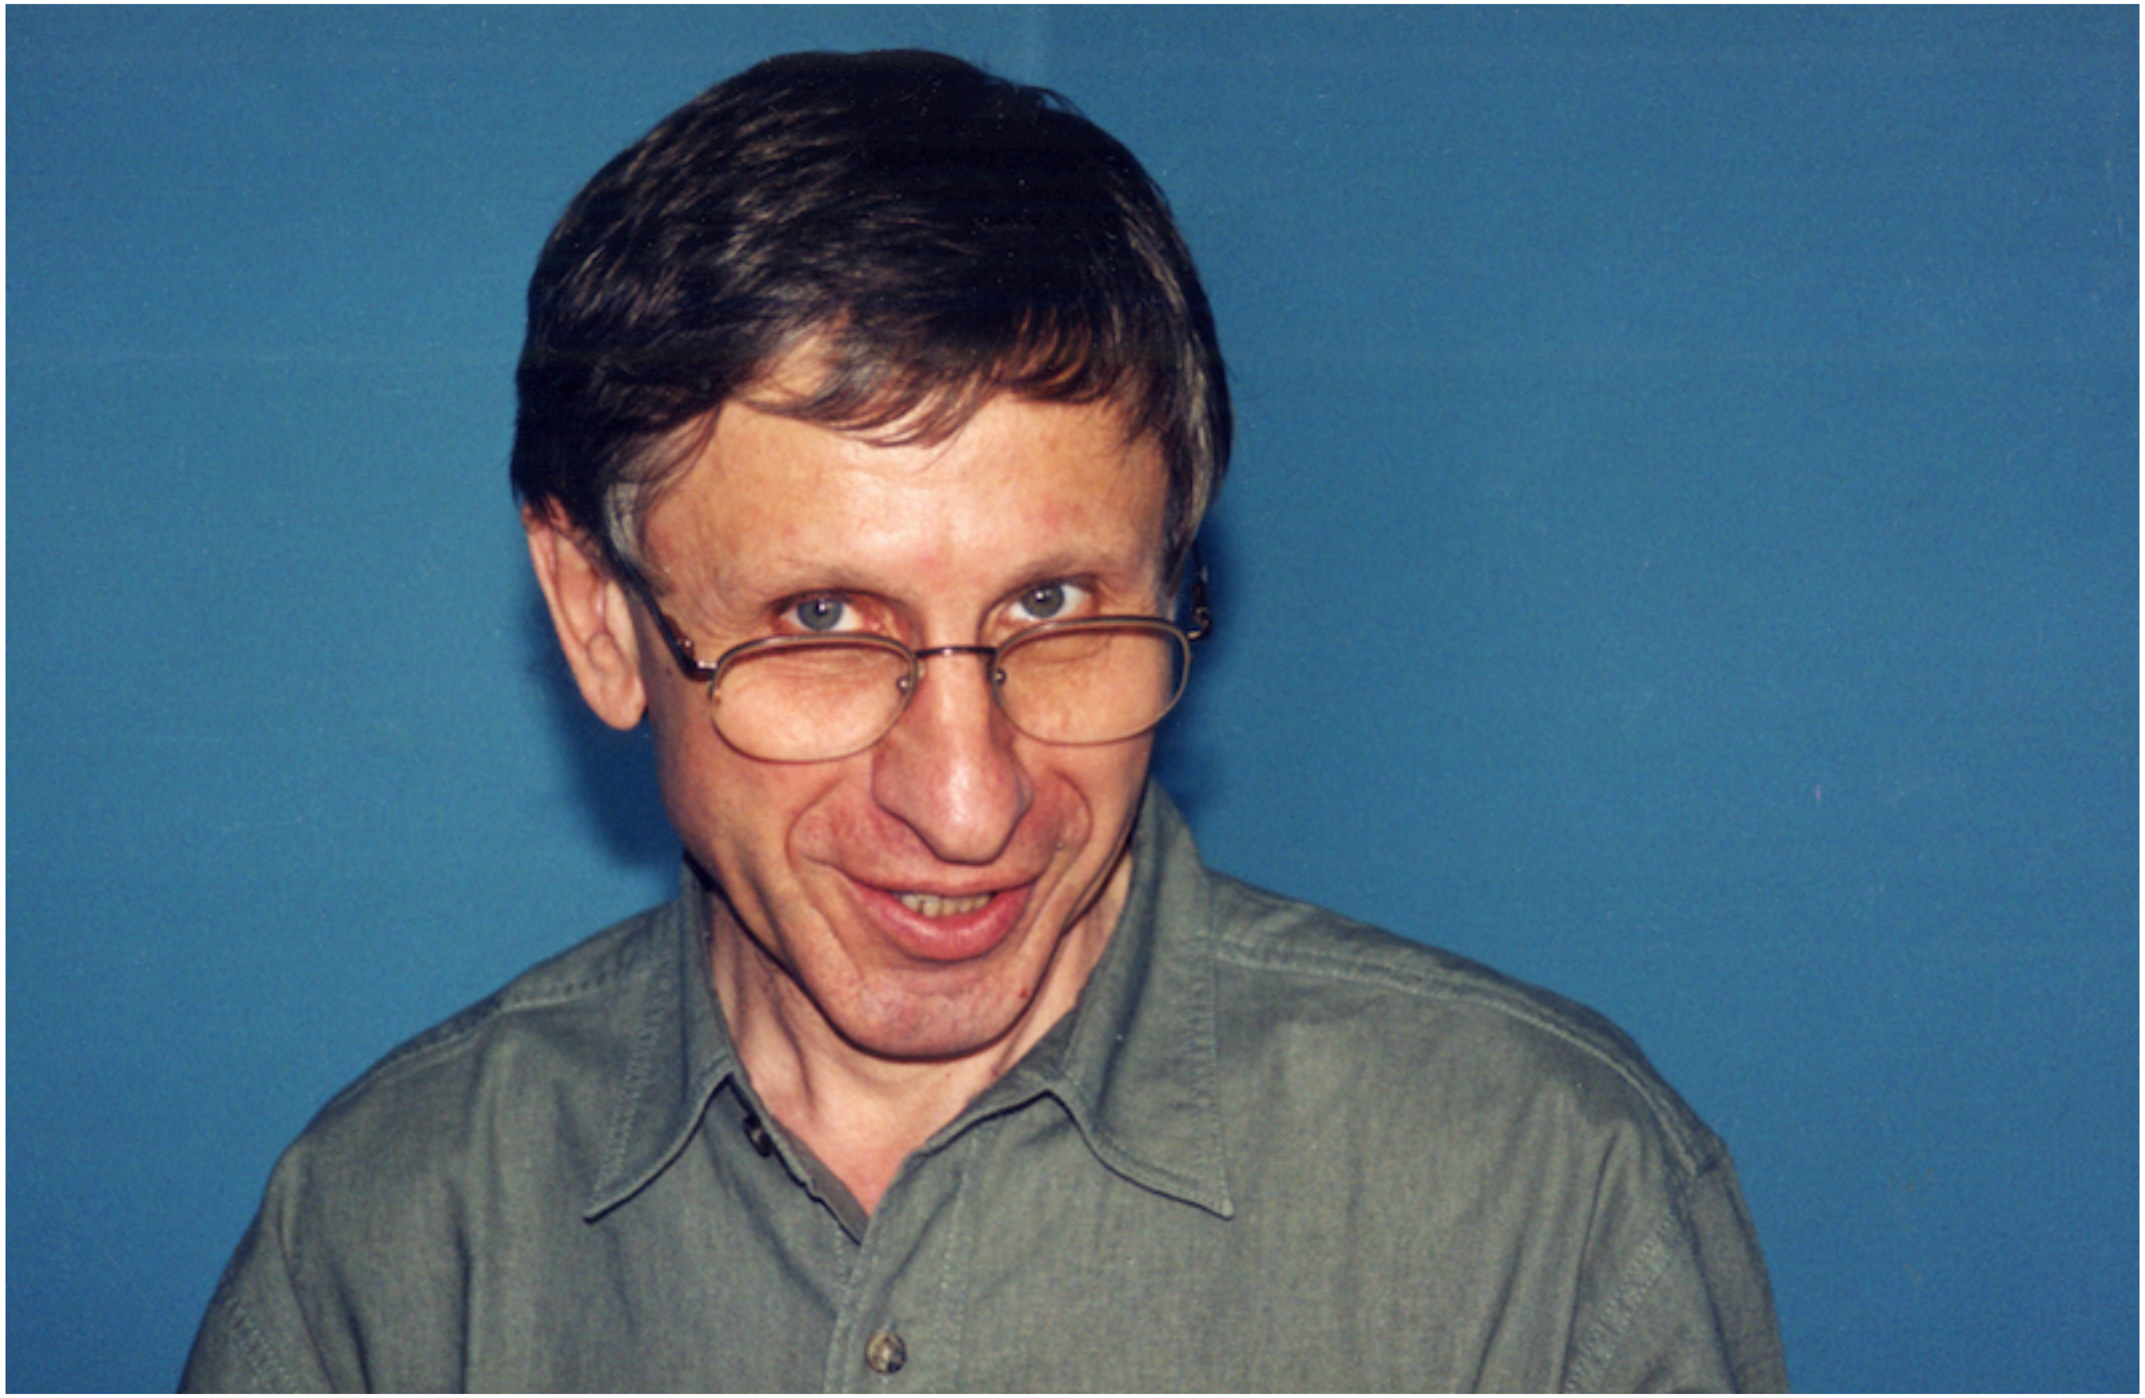
QCHS 2021

The XIVth Quark confinement
and the Hadron spectrum conference

August, 2021
Stavanger (Norway)



This talk is dedicated to Simon Eidelman

What's the goal of this analysis?

To estimate the admixtures of the η and η' mesons to the physical π^0

$$|\pi^0\rangle = |\pi_3\rangle + \epsilon\,|\eta\rangle + \epsilon'\,|\eta'\rangle$$

where π_3 is the I_3=0 state of the pseudoscalar isospin triplet

The responsible of this mixing is isospin breaking

T. Feldmann, P. Kroll and B. Stech, Phys. Lett. B449 (1999) 339

$$\epsilon = 1.4\,\% \qquad \epsilon' = 0.37\,\%$$

η-η' mixing: a reminder

octet-singlet basis

$$|\eta\rangle = \cos\theta_P\,|\eta_8\rangle - \sin\theta_P\,|\eta_0\rangle$$

$$|\eta'\rangle = \sin\theta_P\,|\eta_8\rangle + \cos\theta_P\,|\eta_0\rangle$$

$$|\eta_8\rangle = \frac{1}{\sqrt{6}}\,|u\bar{u}+d\bar{d}-2s\bar{s}\rangle$$

$$|\eta_0\rangle = \frac{1}{\sqrt{3}}\,|u\bar{u}+d\bar{d}+s\bar{s}\rangle$$

quark-flavour basis

$$|\eta\rangle = \cos\phi_P\,|\eta_{\mathrm{NS}}\rangle - \sin\phi_P\,|\eta_{\mathrm{S}}\rangle$$

$$|\eta'\rangle = \sin\phi_P\,|\eta_{\mathrm{NS}}\rangle + \cos\phi_P\,|\eta_{\mathrm{S}}\rangle$$

$$|\eta_{\mathrm{NS}}\rangle = \frac{1}{\sqrt{2}}\,|u\bar{u}+d\bar{d}\rangle$$

$$|\eta_{\mathrm{S}}\rangle = |s\bar{s}\rangle$$

$$\theta_P = \phi_P - \arctan\sqrt{2} \simeq \phi_P - 54.7^\circ$$

η-η' is heavily influenced by the $U(1)_A$ of QCD

The theoretical model

The most general $SU(3)_F$-symmetric effective Lagrangian consistent with Lorentz, P and C invariance

$$\mathscr{L}_{VP\gamma} = g_e \epsilon_{\mu\nu\alpha\beta} \partial^\mu A^\nu \mathrm{Tr}[Q(\partial^\alpha V^\beta P + P \partial^\alpha V^\beta)]$$

supplemented with conventional quark model ideas to introduce flavour and isospin breaking

- **Magnetic dipole transitions**

$$\mu_q = e_q / 2m_q \qquad 1 - s_e \equiv \overline{m}/m_s$$

- **Relative overlap between the P and V wavefunctions**

OZI-rule: $Z_\pi = \langle \pi | \omega_{\mathrm{NS}} \rangle = \langle \pi | \rho \rangle \quad Z_{NS} = \langle \eta_{\mathrm{NS}} | \omega_{\mathrm{NS}} \rangle = \langle \eta_{\mathrm{NS}} | \rho \rangle \quad Z_S = \langle \eta_{\mathrm{S}} | \omega_{\mathrm{S}} \rangle$

The theoretical model

π^0-η-η' mixing in the quark-flavour basis

$$\begin{pmatrix} \pi^0 \\ \eta \\ \eta' \end{pmatrix} = \begin{pmatrix} 1 & \epsilon_{12} & \epsilon_{13} \\ -\epsilon_{12}\mathrm{c}\phi_{23} + \epsilon_{13}\mathrm{s}\phi_{23} & \mathrm{c}\phi_{23} & -\mathrm{s}\phi_{23} \\ -\epsilon_{13}\mathrm{c}\phi_{23} - \epsilon_{12}\mathrm{s}\phi_{23} & \mathrm{s}\phi_{23} & \mathrm{c}\phi_{23} \end{pmatrix} \begin{pmatrix} \pi_3 \\ \eta_{\mathrm{NS}} \\ \eta_{\mathrm{S}} \end{pmatrix}$$

To compare to Kroll's results:

$$\begin{pmatrix} \epsilon_{12} \\ \epsilon_{13} \end{pmatrix} = \begin{pmatrix} \mathrm{c}\phi_P & \mathrm{s}\phi_P \\ -\mathrm{s}\phi_P & \mathrm{c}\phi_P \end{pmatrix} \begin{pmatrix} \epsilon \\ \epsilon' \end{pmatrix}$$

To compare to Escribano et al.'s results:

$$\begin{pmatrix} \epsilon_{12} \\ \epsilon_{13} \end{pmatrix} = \frac{1}{\sqrt{3}} \begin{pmatrix} \mathrm{c}\theta_P - \sqrt{2}\,\mathrm{s}\theta_P & \mathrm{s}\theta_P + \sqrt{2}\,\mathrm{c}\theta_P \\ -\mathrm{s}\theta_P - \sqrt{2}\,\mathrm{c}\theta_P & \mathrm{c}\theta_P - \sqrt{2}\,\mathrm{s}\theta_P \end{pmatrix} \begin{pmatrix} \epsilon_{\pi\eta} \\ \epsilon_{\pi\eta'} \end{pmatrix}$$
