(2)

• Sign problem solved by a dual formulation: $\phi_x \rightarrow \{k_{x,\nu}, l_{x,\nu}\}$ integer fields, Gattringer, Kloiber, arxiv:1206.2954

• Complex scalar field in 1+1D with nonzero chemical potential

$$S = \int dx_0 dx_1 \left(|D_0 \phi|^2 - |\partial_1 \phi|^2 - m^2 |\phi|^2 - \lambda |\phi|^4 \right), \quad D_0 = \partial_0 - i\mu$$
(1)

Discretized action

$$S_{lat} = \sum_{x} \left(\eta |\phi_{x}|^{2} + \lambda |\phi_{x}|^{4} - \sum_{\nu=1}^{2} \left(e^{\mu \, \delta_{\nu,2}} \phi_{x}^{*} \phi_{x+\hat{\nu}} + e^{-\mu \, \delta_{\nu,2}} \phi_{x}^{*} \phi_{x-\hat{\nu}} \right) \right), \quad \eta = 2D + m^{2}$$
(2)

- Sign problem solved by a dual formulation: $\phi_x \rightarrow \{k_{x,\nu}, l_{x,\nu}\}$ integer fields, Gattringer, Kloiber, arxiv:1206.2954
- Regression task: predicting observables

$$n = \frac{1}{N} \sum_{x} k_{x,2}, \qquad |\phi|^2 = \frac{1}{N} \sum_{x} \frac{W(f_x + 2)}{W(f_x)}$$
(3)

$$f_{x} = \sum_{\nu} [|k_{x,\nu}| + |k_{x-\hat{\nu},\nu}| + 2(l_{x,\nu} + l_{x-\hat{\nu},\nu})], \quad W(f_{x}) = \int_{0}^{\infty} \mathrm{d}x \, x^{f_{x}+1} \mathrm{e}^{-\eta x^{2} - \lambda x^{4}}$$
(4)

Architecture comparison

- Systematic architecture search with optuna, Akiba et al., arxiv:1907.10902
- 10 instances of the winning architectures are retrained from scratch for various training set size
- EQ beats ST and FL for any number of training samples
- EQ improves with more samples, while the other two do not
- Data augmentation does not help the two non-equivariant architectures

Silver blaze phase transition

- (日)

Silver blaze phase transition

Training on both phases is not 0.6necessary as long as the expression of the observables is independent of the $\frac{1}{2}$ 0.4transition (3.6) 0.4

Generalization to other lattice sizes and physical parameters

- FL cannot be tested on different lattice sizes
- Training only on 60×4
- Kink in ST at 100 × 5 due to s = 2 in spatial pooling layer
- EQ clearly outperforms ST
- Problem already tackled in literature with an FL trained on both phases on 200×10 reaching test loss of 10^{-6}

Extrapolation to larger chemical potentials

A (1) > A (2) > A

Why do ST and FL fail?

- Worst performing ST instance predicts correctly when tested on $\mu = 1.05$
- Mispredicts values not present in the training set
- Best ST generalizes well
- No EQ instance features a behavior like worst ST

Detecting flux violations

The field k obeys the conservation law $\sum_{\nu} (k_{x,\nu} - k_{x-\hat{\nu},\nu}) = 0$. We artificially created flux violations to be detected by the models.

(a) Example field configuration

(b) Feature maps of convolutional network in best EQ and ST models

- 2x2 convolutions are necessary for this task
- Similar approach with optuna

Matteo Favoni (TU Wien)

< ∃ ►

Results

Training at $(\eta, \mu) = (4.25, 1)$ and (4.01, 1.5) on 8x8 lattice with $N_{train} = 4000$; testing at $\eta \in \{4.01, 4.04, 4.25\}$, $\mu \in \{1, 1.25, 1.5\}$ on 4 lattice sizes

QCHS 2021 12 / 24

Counting flux violations

• Simplified version of counting problems (e.g.: crowd counting)

Counting flux violations

- Simplified version of counting problems (e.g.: crowd counting)
- Training only at 0 and 5 worms (we train on 4 combinations of parameters out of 396 used for testing) with $N_{train} = 20000$
