

Maximum latent heat of neutron star matter without GR

Felipe J. Llanes-Estrada & Eva Lope-Oter
(earlier collaborators, M. Alford & A. Windisch)

5/Aug/2021 Virtual Quark Confinement & Hadron Spectrum

Older prerecorded talk at <https://youtu.be/5FGpVDpD8kU>

Outline

The Seidov limit

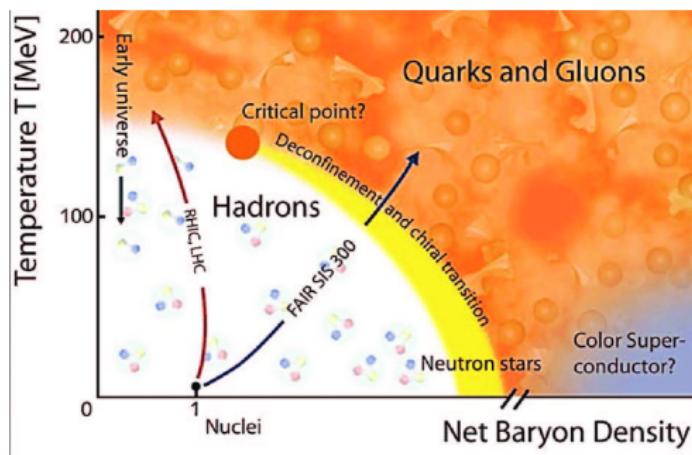

Modified gravity

The nEoS sets at Complutense

Latent heat: a new bound

Conclusions

Maybe 1st order phase transitions in strong matter

<http://www.gsi.de/fair/experiments/CBM>

Specific latent heat L

- ▶ Diagnostic for progress on the Eqn. of State in neutron stars
- ▶ Pure number in natural units

Substance/transition	L
He-3 superfluid	$1.5 \mu\text{J/mol} = 5.5 \times 10^{-24}$
Ice-water	$79.7 \text{ cal/g} = 3.71 \times 10^{-12}$
Nuclear evaporation	$30 \text{ MeV/A} = 3.2 \times 10^{-2}$
Neutron star matter?	$O(0.1)?$

Specific latent heat L

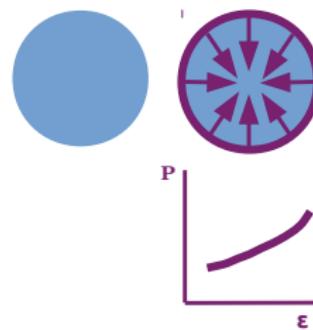

- ▶ Diagnostic for progress on the Eqn. of State in neutron stars
- ▶ Pure number in natural units

Substance/transition	L
He-3 superfluid	$1.5 \mu\text{J/mol} = 5.5 \times 10^{-24}$
Ice-water	$79.7 \text{ cal/g} = 3.71 \times 10^{-12}$
Nuclear evaporation	$30 \text{ MeV/A} = 3.2 \times 10^{-2}$
Neutron star matter?	$O(0.1)?$

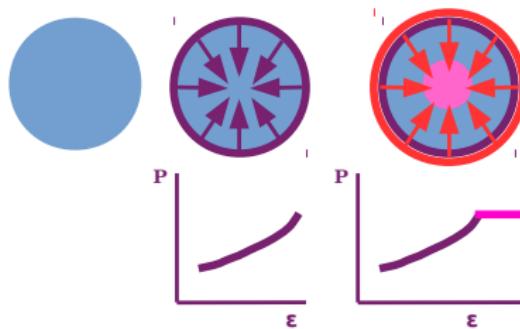

Aggregating mass to a neutron star

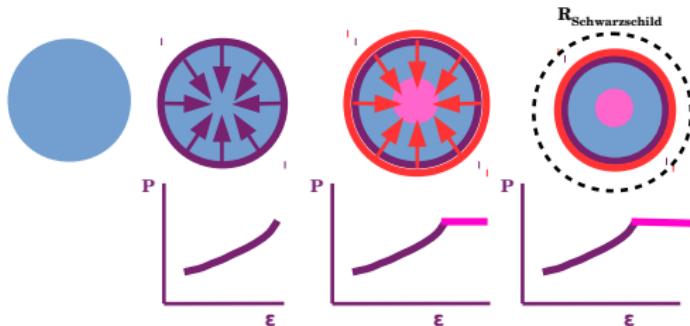

Aggregating mass to a neutron star

Aggregating mass: 1st order phase transition

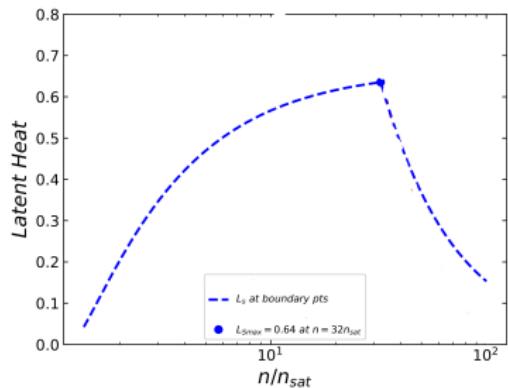

Aggregating mass: 1st order phase transition

If the phase transition is “long”, gravitational collapse

Seidov limit

$$L = P_H \frac{\varepsilon_E - \varepsilon_H}{\varepsilon_E \varepsilon_H}$$

Seidov's approximation:

$$\varepsilon_E - \varepsilon_H = \varepsilon_H \left(\frac{1}{2} + \frac{3}{2} \frac{P_H}{\varepsilon_H} \right)$$

The maximum tolerable latent heat
depends on the onset point of the phase transition

Outline

The Seidov limit

Modified gravity

The nEoS sets at Complutense

Latent heat: a new bound

Conclusions

Testing Einstein's GR and constraining modifications

$$G_{\mu\nu} = \frac{8\pi G}{c^4} T_{\mu\nu}$$

- ▶ Very well tested at solar-system (weak field)
- ▶ Well tested in binary pulsars (weak field)
- ▶ Tests starting near black holes and N^* mergers (strong field)
- ▶ Gravitational wave propagation

But all are tests of the LHS

$$G_{\mu\nu} = \frac{8\pi G}{c^4} T_{\mu\nu}$$

Need to assess the Neutron Star interior!

But all are tests of the LHS

$$G_{\mu\nu} = \frac{8\pi G}{c^4} T_{\mu\nu}$$

Need to assess the Neutron Star interior!

Distinguishing Nuclear matter- from Gravitational- effects

The strong equivalence principle difficults assigning corrections to either T or G

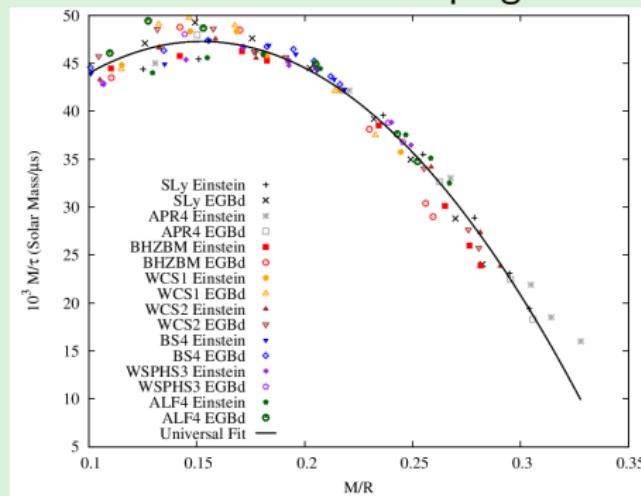

Example: cosmological constant

$$G_{\mu\nu} + \lambda g_{\mu\nu} = \frac{8\pi G}{c^4} T_{\mu\nu}$$

Same problem in neutron stars

So here an example from home

N-Star normal mode damping time against mass

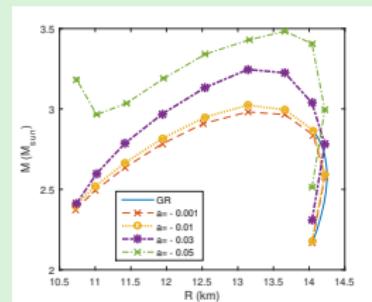

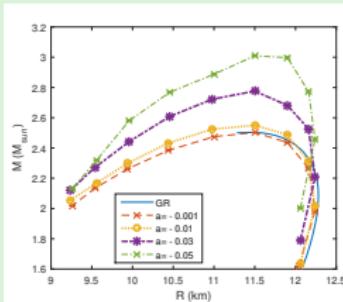

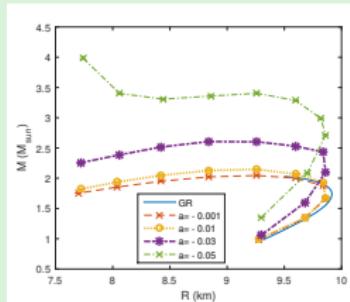

Can displace the curve with both EOS and theory

EITHER test the EoS
OR test GR
but not both

(Blázquez-Salcedo,
and Navarro-Lérida @ UCM)

González-Romero

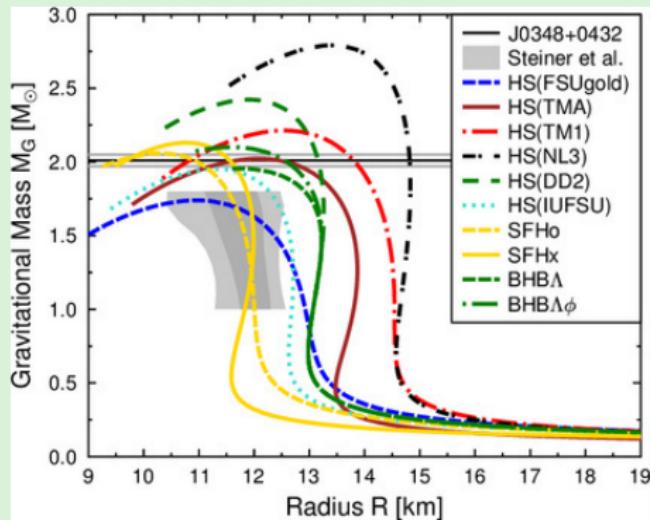

$R + aR^2$ gravity: N-star mass increased for large a

- ▶ State equations of Hebeler *et al.* APJ773:11 (2013)
- ▶ Matching to exterior Schwarzschild (careful: lot of energy there)
- ▶ Find heavier stars
- ▶ Can also find twin branches from modified gravity

(M. Aparicio Resco *et al.*, Phys. Dark Universe 2016; also works by Odintsov and coll. and Yazadjiev & Doneva)

But same effect upon changing the EoS

<https://astro.physik.unibas.ch/people/matthias-hempel/equations-of-state.html>

Therefore, need to control Hadron input

- ▶ In particular, the Seidov bound on L is weaker if gravity is less intense inside a neutron star

What is $T_{\mu\nu}$ in a neutron star?
(purely from hadron theory)

Therefore, need to control Hadron input

Latent heat: a new bound

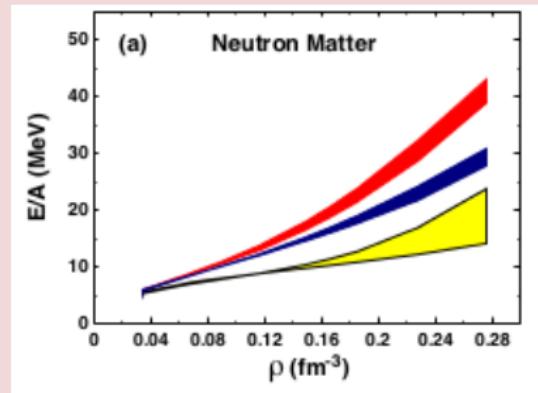

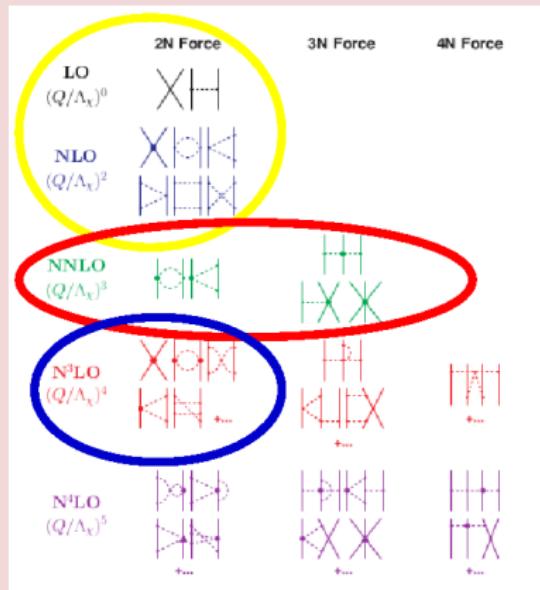

Conclusions

René Descartes taught us

The first was never to accept anything for true which I did not clearly know to be such; that is to say, carefully to avoid precipitancy and prejudice, and to comprise nothing more in my judgment than what was presented to my mind so clearly and distinctly as to exclude all ground of doubt.

NNLO+ part of N^3LO

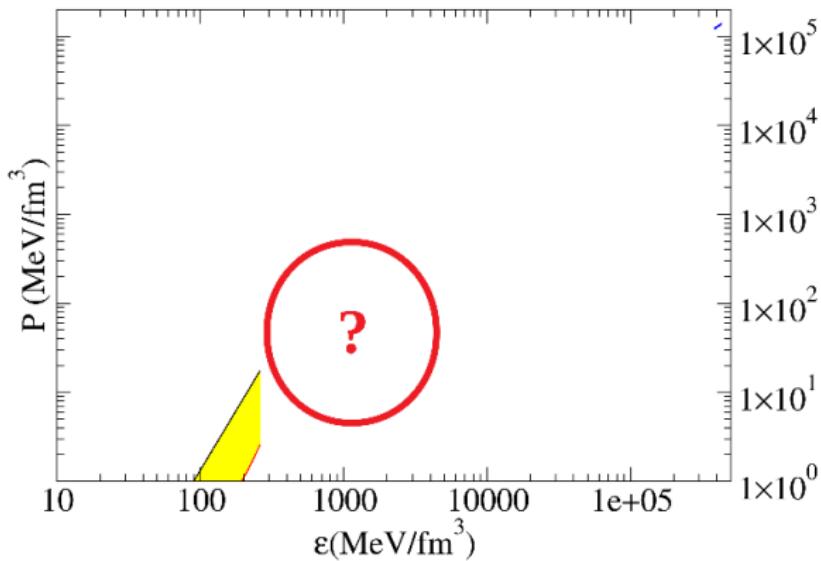

From N^3LO only 2-body part
 (to add 3-body, need to refit triton)

Sammarruca et al. (INFN-Idaho) Proc. of Science Chiral Dynamics 15 026 (2016)

But the bulk of a neutron star has higher density

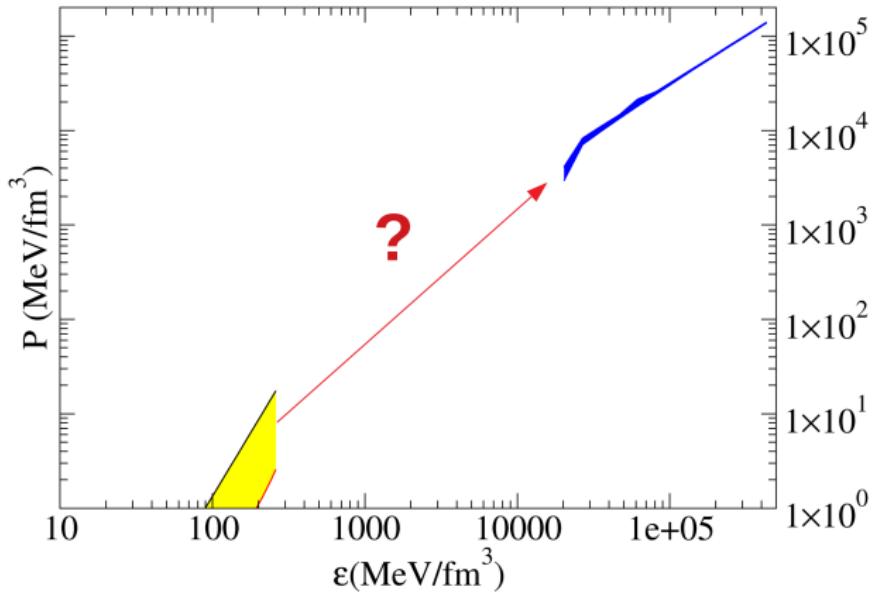

EoS Idaho Chiral + pQCD

nEoS

neutron matter Equation of State

- You can find **Equations of State for neutron stars** constrained by basic principles and generated with **Hadron Physics input alone** (low-density: Chiral Perturbation Theory for neutron matter; high-density pQCD; intermediate density: monotonicity and causality).
- In particular, no Astrophysics nor General Relativity input has been used. Thus, our sets are **less constrained** than others, but also less biased: you may want to use them, for example, if you are thinking of **testing General Relativity or modified theories of gravity** with neutron stars.
- Random sampling of allowed band in the energy density/pressure diagram. Agnostic about exotic phases in the QCD diagram. Phase transitions are in principle allowed.
- **Citation:** Eva Lope Oter, Andreas Windisch, Felipe J. Llanes-Estrada and Mark Alford, [arXiv:1901.05271](https://arxiv.org/abs/1901.05271)
- All sets contain files with two columns of floating-point numbers (ϵ, P) in MeV/fm 3
- Given for two baryon chemical potentials at which pQCD is matched to the intermediate density region.

Radiation lobes in a merger for various reduced masses

Monotony: derivative is positive or null

Monotony: derivative is positive or null

Monotony: derivative is positive or null

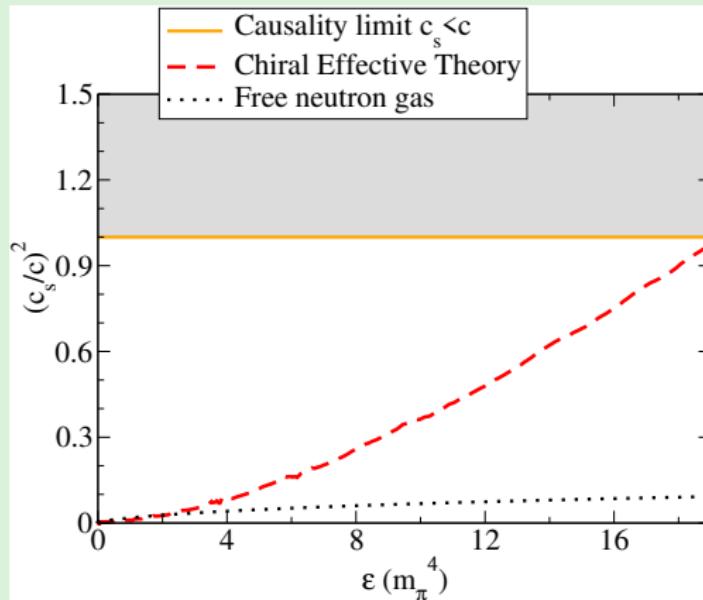

$P(\rho)$ will be **below** whatever Neutron Matter computation yields

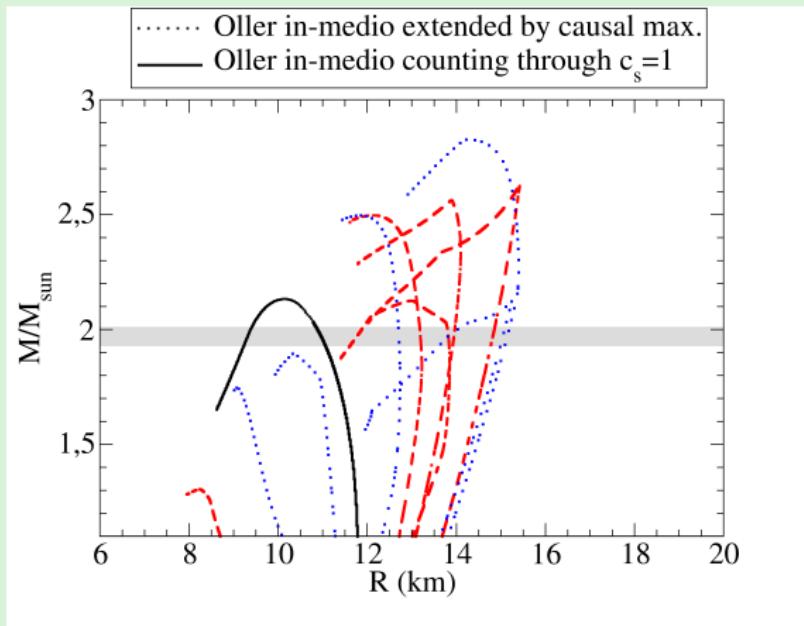

Anything “exotic” beyond neutrons is a softener
 1st order phase transition → latent heat → zero derivative

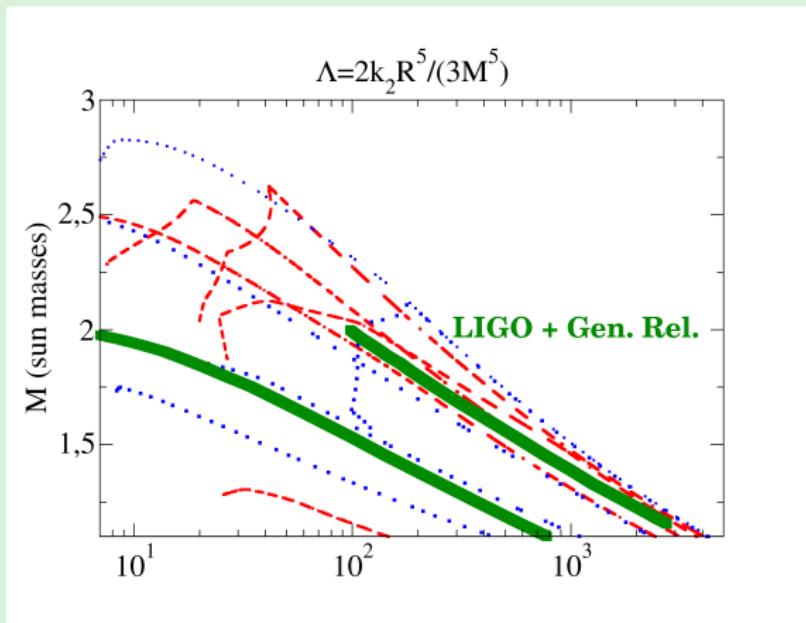

Hardness limited by causality: $c_s = \sqrt{dP/d\rho} \leq c$

Example use: mass-radius diagram in GR

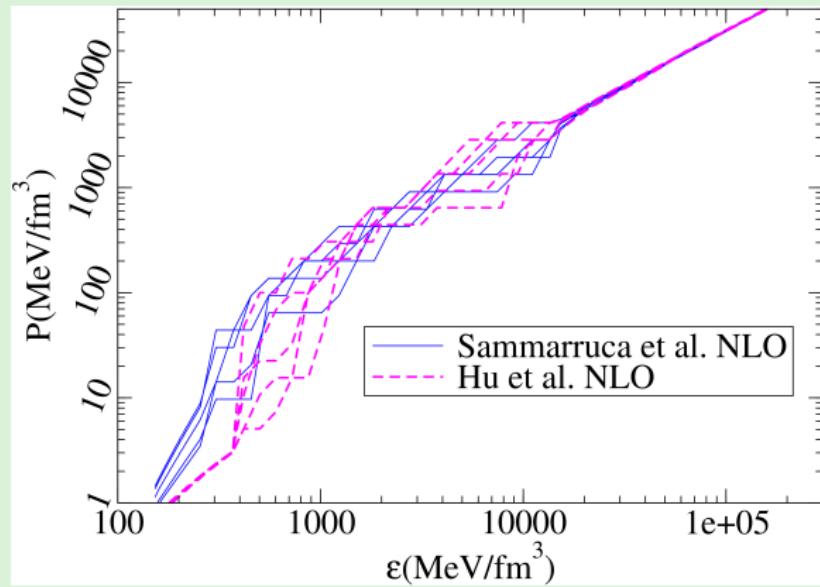

Example use: Tidal deformability

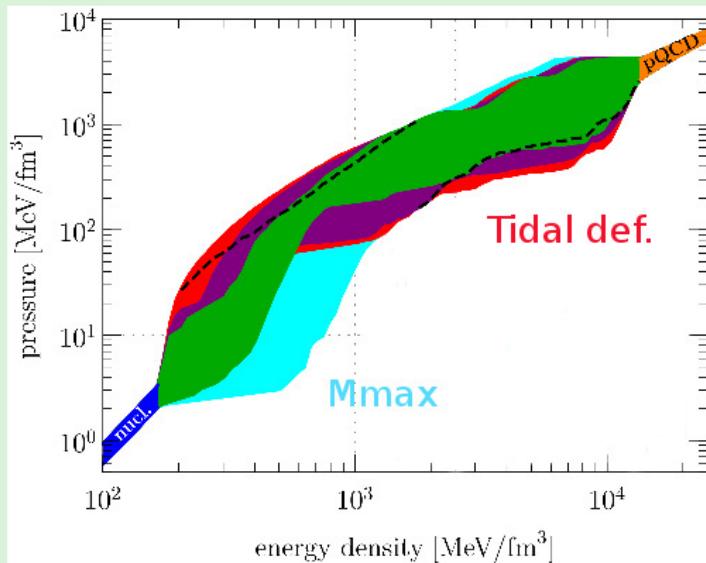

(Green band from aLIGO GW170817 + General Relativity)

Differences with other sets: nEoS knows no astrophysics

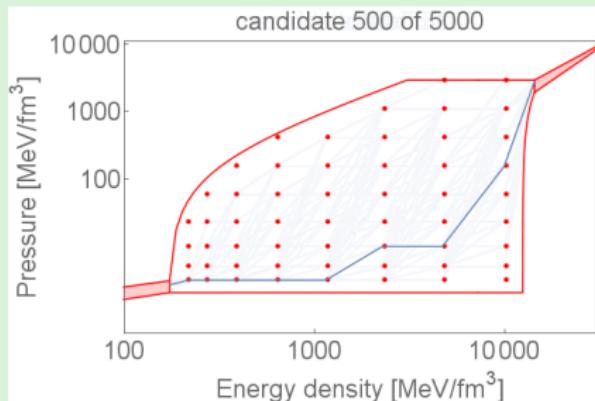

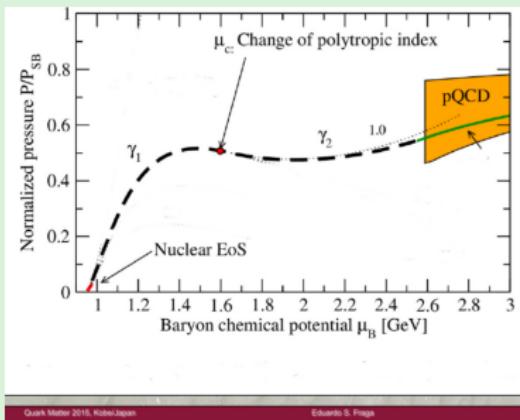

EOS from first principles + mass + tidal constraints

Kurkela et al. 1711.02644

If you can assume General Relativity, this work is way tighter
but to constrain beyond GR theories, visit the nEoS webpage!

Interpolation between low and high P

Polytropic $P \propto \rho^\gamma$

Polytropic $P \propto \rho^\gamma$ vs. nEoS linear interpolation ($\gamma = 0, 1$)
 nEoS more naturally allows for 1st order phase transitions
