Conclusions
Path integral

\[ Z_f = \text{Tr}[\exp(-\varepsilon H_1) \exp(-\varepsilon H_2) \ldots \exp(-\varepsilon H_M)]^N \]
\[ = \sum_{[n]} \text{Sign}[n] \exp(-S[n]) \]
Sign problem of fermionic path integrals

\[ Z_f = \text{Tr} \exp(-\beta H) = \sum_{[n]} \text{Sign}[n] \exp(-S[n]) \ , \quad \text{Sign}[n] = \pm 1 \]

Average sign is exponentially small

\[ \langle \text{Sign} \rangle = \frac{\sum_{[n]} \text{Sign}[n] \exp(-S[n])}{\sum_{[n]} \exp(-S[n])} = \frac{Z_f}{Z_b} = \exp(-\beta V \Delta f) \]

The statistical error is exponentially large

\[ \frac{\sigma_{\text{Sign}}}{\langle \text{Sign} \rangle} = \frac{\sqrt{\langle \text{Sign}^2 \rangle - \langle \text{Sign} \rangle^2}}{\sqrt{N} \langle \text{Sign} \rangle} = \frac{\exp(\beta V \Delta f)}{\sqrt{N}} . \]

Some very hard sign problems are NP complete

Some specific exponentially hard sign problems were solved completely using meron-cluster algorithms

Quantum Simulators for $\mathbb{C}P(N - 1)$ Models

Towards Quantum Simulations of QCD

Conclusions
Status of the sign problem in QCD

The exponentially hard sign problem remains most challenging. But several groups are working (exponentially?) hard on it.

Questions related to complex Langevin (stochastic quantization):
• How to guarantee correct results?
• How to avoid excursions away from the $SU(3)$ group manifold?
• How to deal with boundary terms at poles of the drift force?

Questions related to Lefshetz thimbles (complex saddle points):
• How to flow close to the thimble?
• How to efficiently deal with the Jacobian?
• How to sample multiple thimbles?

Status of the sign problem in QCD

Status of the sign problem in QCD

Questions related to Taylor expansion around $\mu = 0$ and analytic continuation from imaginary $\mu$:

- How to solve signal-to-noise problems in expansion coefficients?
- How to truncate or resum the expansion?
- How to determine the radius of convergence?

It might be interesting to explore:

- Other bases of the Hilbert space (includes dualization)
- Real-time evolution with or without dissipation
- New strategies for completely solving exponentially hard sign problems

Keep searching: many things remain to be explored.

Conclusions
Richard Feynman’s vision from 1982 (Int. J. Theor. Phys. 21)

“I’m not happy with all the analyses that go with just the classical theory, because nature isn’t classical, dammit, and if you want to make a simulation of nature, you’d better make it quantum mechanical, and by golly it’s a wonderful problem, because it doesn’t look so easy.”

“It does seem to be true that all the various field theories have the same kind of behavior, and can be simulated in every way, apparently, with little latticeworks of spins and other things.”
Ultra-cold atoms in optical lattice as analog quantum simulator

Transition from a superfluid to a Mott insulator

Quantum simulations have been accurately verified by classical simulations
S. Trotzky, L. Pollet, F. Gerbier, U. Schnorrberger, I. Bloch, N. Prokovéf, B. Svistunov,
Can heavy-ion collision physics or nuclear astrophysics benefit from quantum simulations in the long run?
• Quantum computer consisting of four trapped Ca ions that act as four qubits, which are manipulated by external laser beams.
• Precisely controllable many-body quantum device, executing a prescribed sequence of quantum gate operations.
• State of simulated system is encoded as quantum information.
• Dynamics is represented by a sequence of quantum gates, following a stroboscopic Trotter decomposition.

Conclusions
Different descriptions of dynamical Abelian gauge fields:
Maxwell’s classical electromagnetic gauge fields
\[ \vec{\nabla} \cdot \vec{E}(\vec{x}, t) = \rho(\vec{x}, t), \quad \vec{\nabla} \cdot \vec{B}(\vec{x}, t) = 0, \quad \vec{B}(\vec{x}, t) = \vec{\nabla} \times \vec{A}(\vec{x}, t) \]

Quantum Electrodynamics (QED) for perturbative treatment
\[ E_i = -i \frac{\partial}{\partial A_i}, \quad [E_i(\vec{x}), A_j(\vec{x}')] = i\delta_{ij}\delta(\vec{x}-\vec{x}'), \quad \left[ \vec{\nabla} \cdot \vec{E} - \rho \right] |\Psi[A]\rangle = 0 \]

Wilson’s \(U(1)\) lattice gauge theory for classical simulation
\[ U_{xy} = \exp \left( ie \int_x^y d\vec{l} \cdot \vec{A} \right) = \exp(i\varphi_{xy}) \in U(1), \quad E_{xy} = -i \frac{\partial}{\partial \varphi_{xy}}, \]
\[ [E_{xy}, U_{xy}] = U_{xy}, \quad \left[ \sum_i (E_{x,x+i} - E_{x-i,x}) - \rho \right] |\Psi[U]\rangle = 0 \]

\(U(1)\) quantum link models for quantum simulation
\[ U_{xy} = S^+_x, \quad U^{\dagger}_{xy} = S^-_x, \quad E_{xy} = S^3_x, \]
\[ [E_{xy}, U_{xy}] = U_{xy}, \quad [E_{xy}, U^{\dagger}_{xy}] = -U^{\dagger}_{xy}, \quad [U_{xy}, U^{\dagger}_{xy}] = 2E_{xy} \]
Hamiltonian formulation of Wilson’s $U(1)$ lattice gauge theory

\[ U = \exp(i\varphi), \quad U^\dagger = \exp(-i\varphi) \in U(1) \]

Electric field operator $E$

\[ E = -i \partial_\varphi, \quad [E, U] = U, \quad [E, U^\dagger] = -U^\dagger, \quad [U, U^\dagger] = 0 \]

Generator of $U(1)$ gauge transformations

\[ G_x = \sum_i (E_{x-\hat{i},i} - E_{x,i}), \quad [H, G_x] = 0 \]

$U(1)$ gauge invariant Hamiltonian

\[ H = \frac{e^2}{2} \sum_{x,i} E_{x,i}^2 - \frac{1}{2e^2} \sum_{x,i\neq j} (U_{x,i} U_{x+j,\hat{i}j}^\dagger U_{x+j,i}^\dagger U_{x,j} + \text{h.c.}) \]

operates in an infinite-dimensional Hilbert space per link.
Quantum link formulation of $U(1)$ lattice gauge theory

$U = S^+, \ U^\dagger = S^-$

Electric field operator $E$

$E = S^3, \ [E, U] = U, \ [E, U^\dagger] = -U^\dagger, \ [U, U^\dagger] = 2E$

Generator of $U(1)$ gauge transformations

$G_x = \sum_i (E_x - \hat{i}, i - E_x, i), \ [H, G_x] = 0$

$U(1)$ gauge invariant Hamiltonian

$H = \frac{e^2}{2} \sum_{x,i} E_{x,i}^2 - \frac{1}{2e^2} \sum_{x,i \neq j} (U_{x,i} U_{x+\hat{i},j} U_{x+\hat{j},i}^\dagger U_{x,j}^\dagger + \text{h.c.})$

operates in a finite-dimensional Hilbert space per link

A quantum simulator with 51 Rb atoms in optical tweezers

realizes the dynamics of spin $\frac{1}{2}$ quantum link models

The spin $\frac{1}{2}$ $U(1)$ quantum link model on a triangular lattice displays novel “nematic” confined phases. Energy distribution for strings connecting charges $\pm 1$ and $\pm 2$:

Quantum circuit allows the resource-efficient quantum simulation of the time-evolution of the order parameter.

Conclusions
Ladder of $SU(N)$ quantum spins embodied with alkaline-earth atoms

$$H = -J \sum_{\langle xy \rangle} T_x^a T_y^{a*}, \quad [T_x^a, T_y^b] = i \delta_{xy} f_{abc} T_x^c$$

Goldstone boson fields in $\mathbb{C}P(N-1) = SU(N)/U(N-1)$

$$P(x)^\dagger = P(x), \quad \text{Tr}P(x) = 1, \quad P(x)^2 = P(x)$$

Low-energy effective action

$$S[P] = \int_0^\beta dt \int_0^L dx \int_0^{L'} dy \text{Tr} \left\{ \rho'_s \partial_y P \partial_y P \\
+ \rho_s \left[ \partial_x P \partial_x P + \frac{1}{c^2} \partial_t P \partial_t P \right] \right\}$$

Very large correlation length

$$\xi \propto \exp(4\pi L' \rho_s / cN) \gg L', \quad \frac{1}{g^2} = L' \rho_s$$

Dimensional reduction to the (1 + 1)-d $\mathbb{C}P(N-1)$ model

$$S[P] = \int_0^\beta dt \int_0^L dx \frac{1}{g^2} \text{Tr} \left[ \partial_x P \partial_x P + \frac{1}{c^2} \partial_t P \partial_t P \right]$$

Ferromagnetic Double-Species BEC in the $\mathbb{C}P(2)$ Model

$\mu_8 = 2 mc^2 \sqrt{3}$

$\mu_3 = mc^2$

$\mu_3 = \mu_s$

$SU(2)_d \times U(1)_d$

Conclusions
\( U(N) \) quantum link operators

\[ U^{ij} = S_1^{ij} + iS_2^{ij}, \quad U^{ij\dagger} = S_1^{ij} - iS_2^{ij}, \quad i, j \in \{1, 2, \ldots, N\}, \quad [U^{ij}, (U^{\dagger})^{kl}] \neq 0 \]

\( SU(N)_L \times SU(N)_R \) gauge transformations of a quantum link

\[ [L^a, L^b] = i f_{abc} L^c, \quad [R^a, R^b] = i f_{abc} R^c, \quad a, b, c \in \{1, 2, \ldots, N^2 - 1\} \]

\[ [L^a, R^b] = [L^a, E] = [R^a, E] = 0 \]

Infinitesimal gauge transformations of a quantum link

\[ [L^a, U] = -\lambda^a U, \quad [R^a, U] = U\lambda^a, \quad [E, U] = U \]

Algebraic structures of different quantum link models

\( U(N) : U^{ij}, L^a, R^a, E, \quad 2N^2 + 2(N^2 - 1) + 1 = 4N^2 - 1 \) \( SU(2N) \) generators

\( SO(N) : O^{ij}, L^a, R^a, \quad N^2 + 2 \frac{N(N - 1)}{2} = N(2N - 1) \) \( SO(2N) \) generators

\( Sp(N) : U^{ij}, L^a, R^a, \quad 4N^2 + 2N(2N + 1) = 2N(4N + 1) \) \( Sp(2N) \) generators

Conclusions
Conclusions

- The exponentially hard sign problem in QCD remains most challenging. Alleviating the problem is worth exploring, at least at moderately high temperature. The investigation of simpler models, which capture some aspects of QCD, is most interesting.
Conclusions

• The exponentially hard sign problem in QCD remains most challenging. Alleviating the problem is worth exploring, at least at moderately high temperature. The investigation of simpler models, which capture some aspects of QCD, is most interesting.

• This seems to be the right time to explore further extending or brain’s abilities by developing quantum hardware.
