# MINERvA Masterclass Start-up

QuarkNet

## What is a Masterclass?

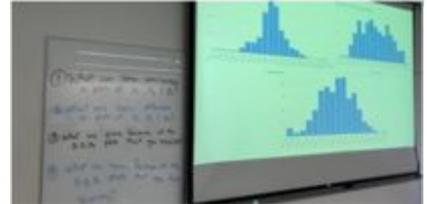

High school students are “Particle Physicists for a Day”

- Intro talk(s) on physics and experiment
- Tour of physics lab
- Ramp up and then...
- Analyze authentic (MINERvA) data
- Finish with (Fermilab) videoconference

Key element:

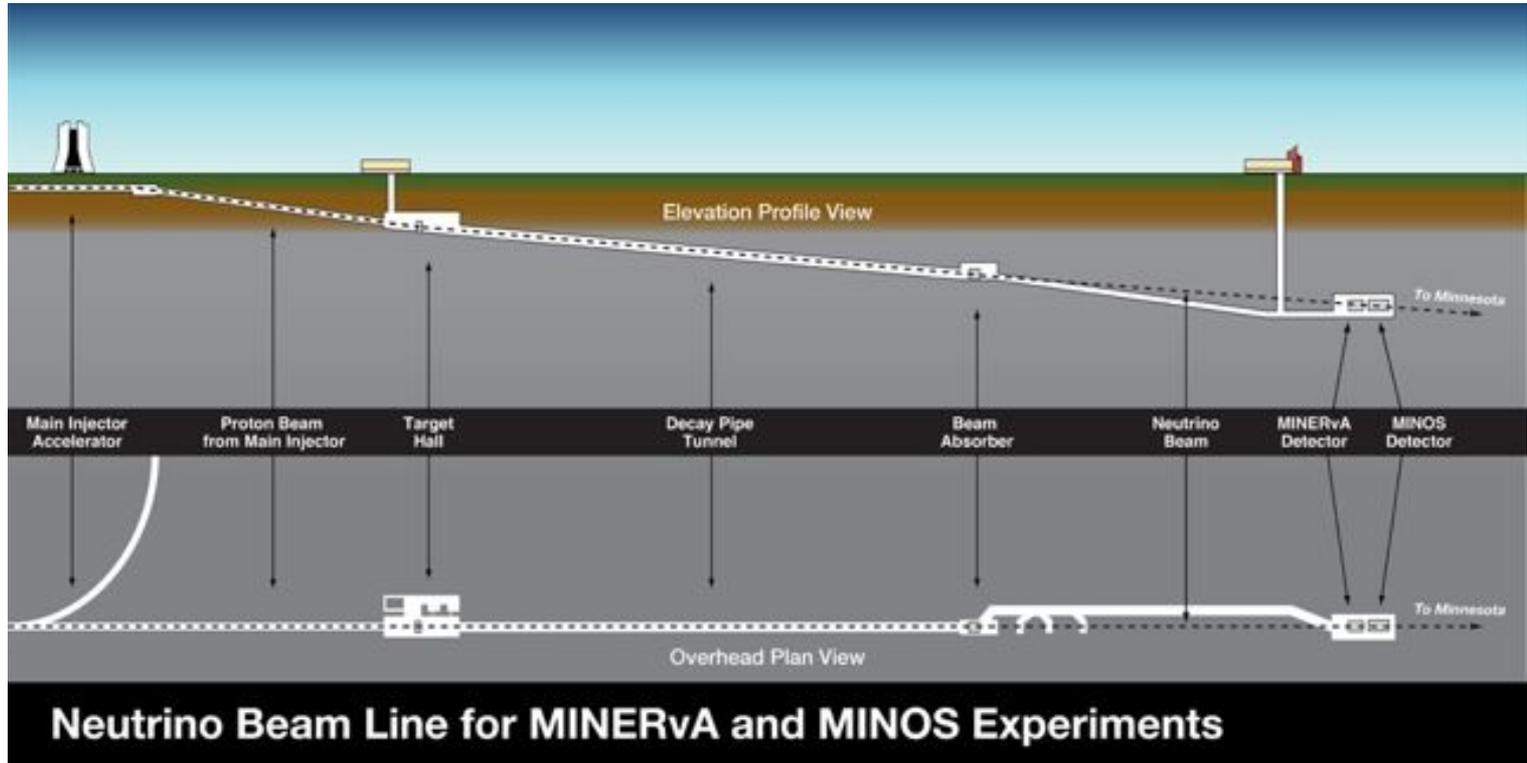

- Student/teacher interaction with physicists

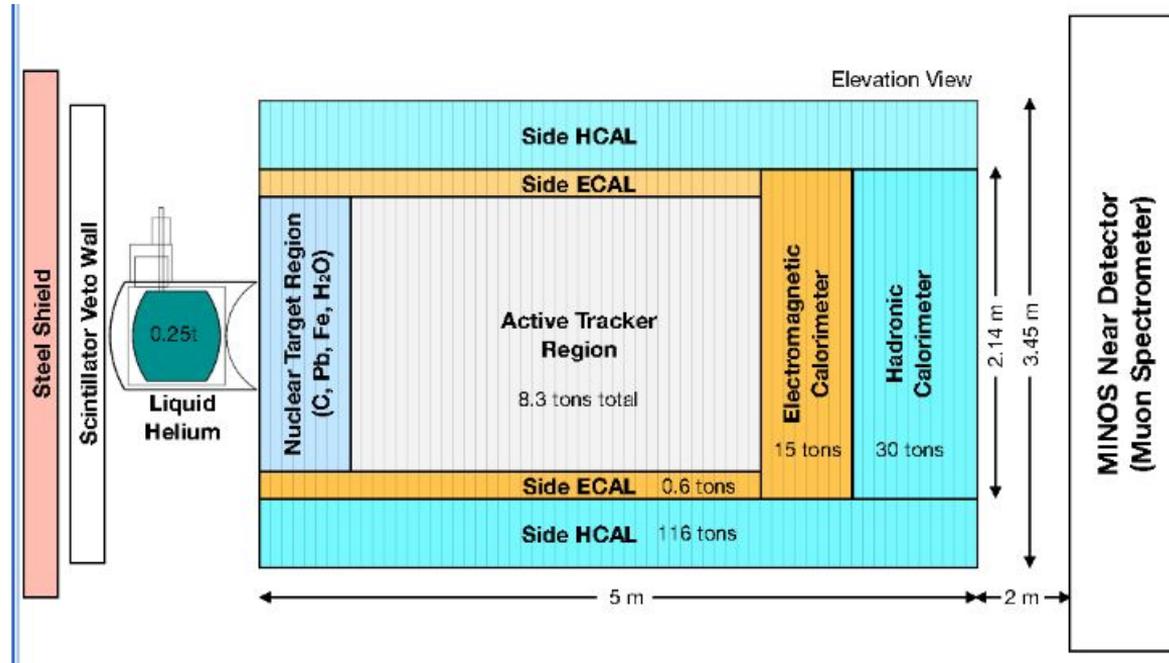

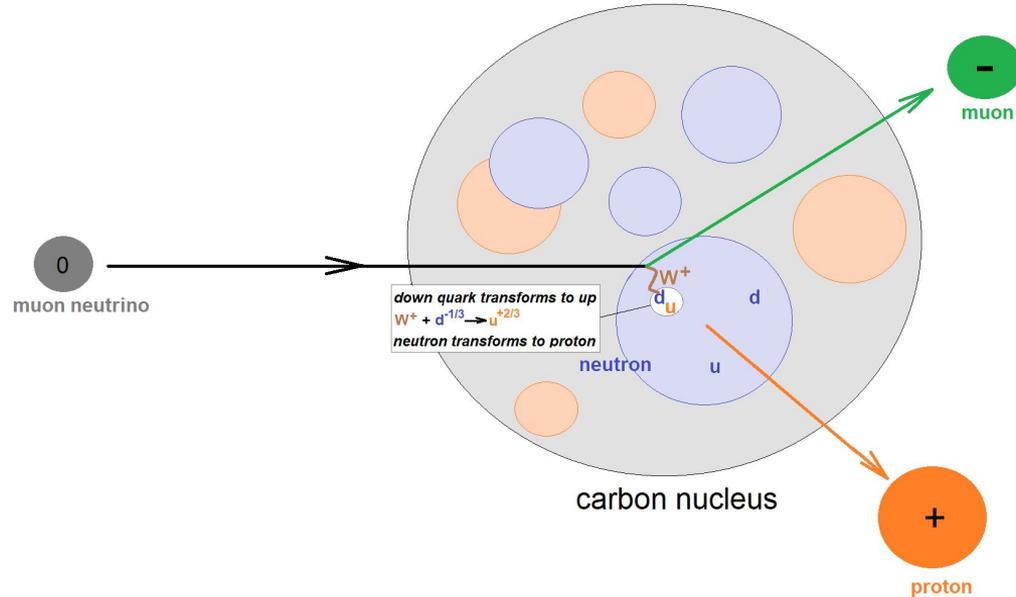

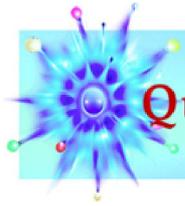

QuarkNet

# MINOS and MINERvA

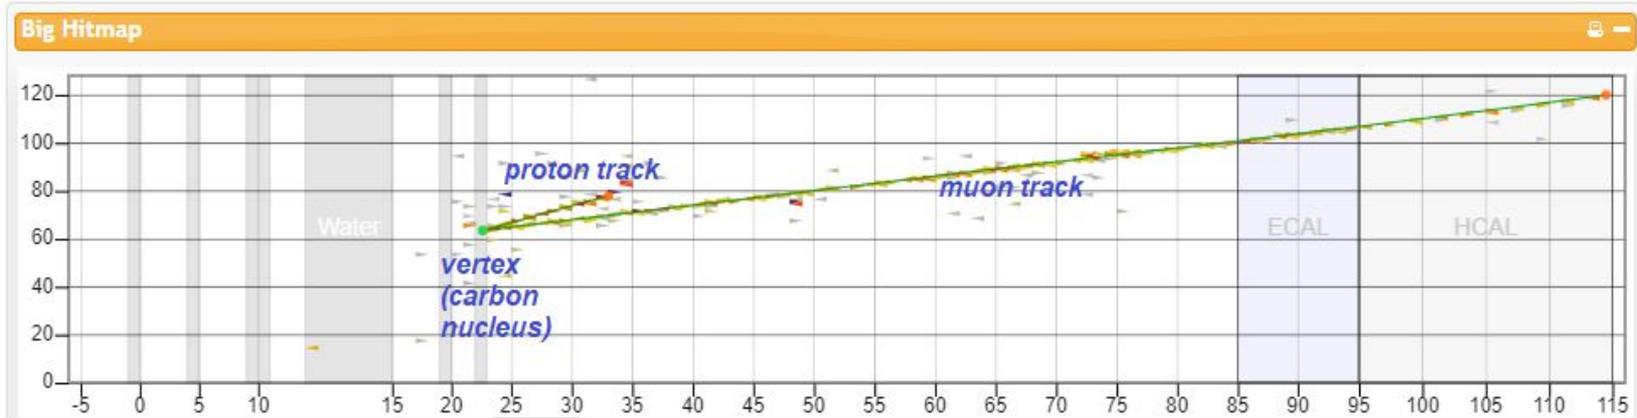

Muon neutrinos hit the carbon target. MINERvA measures the products of the interaction.

A muon neutrino interacts with a carbon nucleus. A muon and a proton are ejected from the nucleus carrying the neutrino momentum.

# Measurement

This is what MINERvA “sees”. The neutrino comes from the left, undetected. It hits a carbon nucleus and interacts with a neutron. The interaction transforms the neutrino into a muon and the neutron into a proton. MINERvA can measure the momentum of each.

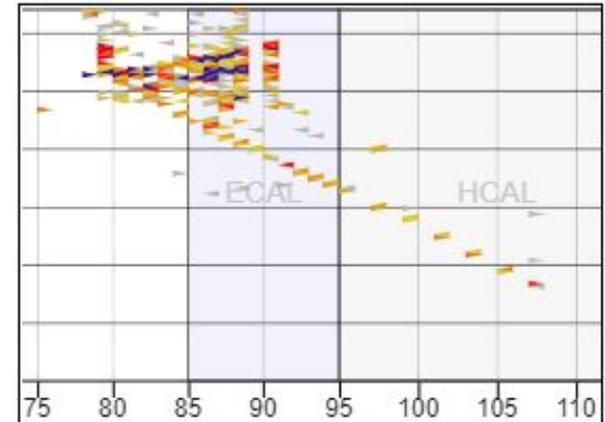

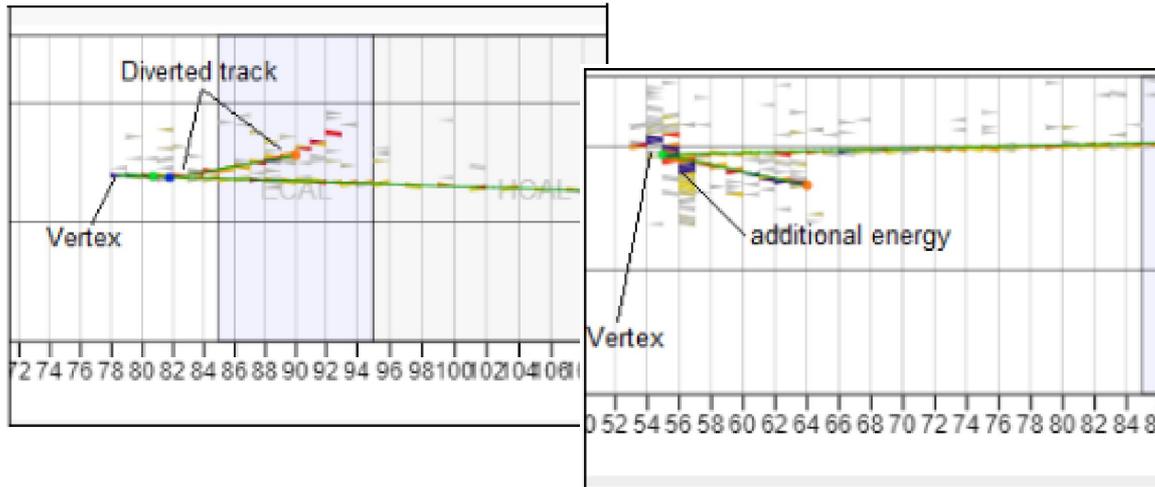

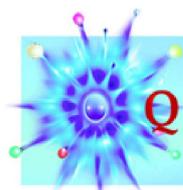

## Signal vs. Background

Background events:

- Do not fit signal paradigm of one short proton track, one long muon track, or
- Confound the ability of MINERvA to measure momentum accurately.

# QuarkNet Measure signal in Arachne

## Arachne

Status: Done!

Data

mergedTuple\_79.root

# Build plots

We can find:

- Neutrino beam energy (almost)
- Uncertainty in proton momentum
- Uncertainty in proton position → nuclear radius

*Model dependent!*
