

Density of states for gravitational waves

Felix Springer

David Schaich

University of Liverpool

The XVth Quark confinement and the Hadron spectrum conference

August 2, 2022

Outline

- ▶ Underlying physics and motivation: Composite Dark Matter
- ▶ Numerical tool: LLR
 - ▶ LLR explained
 - ▶ Review U(1) case
 - ▶ Bulk phase transitions SU(N)
 - ▶ Confinement phase Transition SU(4)

Composite Dark Matter

- ▶ Broad class of composite Dark Matter models
 - ▶ Dark mesons
 - ▶ Dark glueballs
 - ▶ Dark baryons

Composite Dark Matter

- ▶ Broad class of composite Dark Matter models
 - ▶ "Stealth dark matter confinement transition and gravitational waves", LSD Collaboration, arXiv:2006.16429
 - ▶ "Testing the Dark Confined Landscape:From Lattice to Gravitational Waves", Huang et al., arXiv:2012.11614
 - ▶ "Dark Confinement-Deconfinement Phase Transition:A Roadmap from Polyakov Loop Models to Gravitational Waves", Kang et al., arXiv:2101.03795
 - ▶ "Review of strongly-coupled composite dark matter models and lattice simulations", Kribs and Neil, arXiv:1604.04627

Baryon Dark Matter

Baryon Dark Matter

- ▶ New strongly coupled $SU(N)$ gauge sector coupled to new massive fermions

Baryon Dark Matter

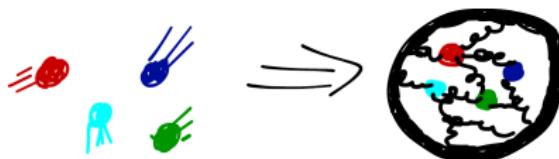

- ▶ New strongly coupled $SU(N)$ gauge sector coupled to new massive fermions
- ▶ Dark Matter candidate: composite 'dark baryon' DM

Baryon Dark Matter

- ▶ New strongly coupled $SU(N)$ gauge sector coupled to new massive fermions
- ▶ Dark Matter candidate: composite 'dark baryon' DM
- ▶ Early-universe $SU(N)$ confinement transition

Baryon Dark Matter

- ▶ New strongly coupled $SU(N)$ gauge sector coupled to new massive fermions
- ▶ Dark Matter candidate: composite 'dark baryon' DM
- ▶ Early-universe $SU(N)$ confinement transition
If confinement transition is first order \rightarrow stochastic background of gravitational waves

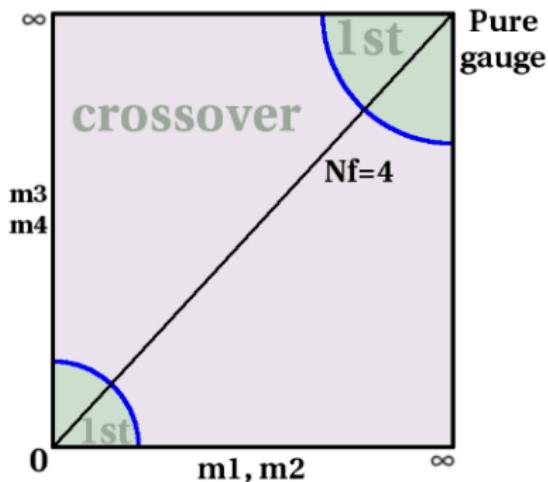

Stealth Dark Matter

Stealth Dark Matter

- ▶ $SU(4)$ gauge theory coupled to four flavors of moderately heavy fermions in the fundamental representation

Stealth Dark Matter

- ▶ $SU(4)$ gauge theory coupled to four flavors of moderately heavy fermions in the fundamental representation
- ▶ Pure gauge $SU(4)$ theory recovered in the 'quenched' case, fermions infinitely massive

Challenges of the Calculation

Challenges of the Calculation

- ▶ Confinement → lattice simulation

Challenges of the Calculation

- ▶ Confinement \rightarrow lattice simulation
- ▶ $SU(4)$ \rightarrow first order phase transition

Challenges of the Calculation

- ▶ Confinement → lattice simulation
- ▶ $SU(4)$ → first order phase transition
 - ▶ Poor performance of standard Monte Carlo techniques

Challenges of the Calculation

- ▶ Confinement \rightarrow lattice simulation
- ▶ $SU(4)$ \rightarrow first order phase transition
 - ▶ Poor performance of standard Monte Carlo techniques

Solution:

Wang-Landau type algorithms

Standard Technique:

$$\langle \mathcal{O} \rangle = \frac{1}{Z(\beta)} \int d\phi \mathcal{O}[\phi] e^{\beta S[\phi]}$$

approximate by

$$\langle \mathcal{O} \rangle = \frac{1}{N} \sum_c \mathcal{O}[\mathcal{C}]$$

Density of States

High dimensional integral:

$$Z(\beta) = \int \mathcal{D}\phi e^{\beta S[\phi]}$$

Density of States

High dimensional integral:

$$Z(\beta) = \int \mathcal{D}\phi e^{\beta S[\phi]}$$

Density of states:

$$\rho(E) = \int \mathcal{D}\phi \delta(S[\phi] - E)$$

Density of States

High dimensional integral:

$$Z(\beta) = \int \mathcal{D}\phi e^{\beta S[\phi]}$$

Density of states:

$$\rho(E) = \int \mathcal{D}\phi \delta(S[\phi] - E)$$

1 dimensional integral:

$$Z(\beta) = \int dE \rho(E) e^{\beta E}$$

Density of States

High dimensional integral:

$$Z(\beta) = \int \mathcal{D}\phi e^{\beta S[\phi]}$$

Density of states:

$$\rho(E) = \int \mathcal{D}\phi \delta(S[\phi] - E)$$

1 dimensional integral:

$$Z(\beta) = \int dE \rho(E) e^{\beta E}$$

Calculate observable:

$$\langle \mathcal{O} \rangle = \frac{1}{Z(\beta)} \int dE \mathcal{O} \rho(E) e^{\beta E}$$

Density of States

Task:

Calculate $\rho(E)$ with near constant relative error over a wide range of E

Density of States

Task:

Calculate $\rho(E)$ with near constant relative error over a wide range of E

Solution:

Linear Logarithmic Relaxation

Re-weighted Expectation Value

Re-weighted expectation value ΔE

$$\begin{aligned}\langle\langle E - E_0 \rangle\rangle_\delta(a) &= \frac{1}{N} \int \mathcal{D}\phi \theta_{E_0, \delta}(E - E_0) e^{-aS} \\ &= \frac{1}{N} \int_{E_0 - \frac{\delta}{2}}^{E_0 + \frac{\delta}{2}} dE (E - E_0) \rho(E) e^{-aE} \\ &= \Delta E\end{aligned}$$

Normalization factor

$$N = \int \mathcal{D}\phi \theta_{E_0, \delta} e^{-aS[\phi]}$$

Set re-weighted expectation value to zero

$$\Delta E(a) = \frac{1}{N} \int_{E_0 - \frac{\delta}{2}}^{E_0 + \frac{\delta}{2}} dE (E - E_0) \rho(E) e^{-aE} = 0$$

Set re-weighted expectation value to zero

$$\Delta E(a) = \frac{1}{N} \int_{E_0 - \frac{\delta}{2}}^{E_0 + \frac{\delta}{2}} dE (E - E_0) \rho(E) e^{-aE} = 0$$

Approximate integral with trapezium rule

Set re-weighted expectation value to zero

$$\Delta E(a) = \frac{1}{N} \int_{E_0 - \frac{\delta}{2}}^{E_0 + \frac{\delta}{2}} dE (E - E_0) \rho(E) e^{-aE} = 0$$

Approximate integral with trapezium rule

Let interval go to zero $\delta \rightarrow 0$

Set re-weighted expectation value to zero

$$\Delta E(a) = \frac{1}{N} \int_{E_0 - \frac{\delta}{2}}^{E_0 + \frac{\delta}{2}} dE(E - E_0) \rho(E) e^{-aE} = 0$$

Approximate integral with trapezium rule

Let interval go to zero $\delta \rightarrow 0$

Solve for a

$$a_0 = \frac{1}{\rho(E_0)} \frac{d\rho(E)}{dE} \Big|_{E=E_0} = \frac{d \ln(\rho(E))}{dE} \Big|_{E=E_0}$$

numerically integrate a and we get ρ with constant relative error!

Integrate the exponent using the Trapezium rule

$$\begin{aligned}\rho(E_N) &= e^{\int_{-\infty}^{E_N} dE' a(E')} \\ &= \rho_c e^{a_0 \frac{\delta_E}{2} + \sum_{k=1}^{N-1} a_k \delta + a_N \delta + \mathcal{O}(\delta^2)}\end{aligned}$$

Integrate the exponent using the Trapezium rule

$$\begin{aligned}\rho(E_N) &= e^{\int_{-\infty}^{E_N} dE' a(E')} \\ &= \rho_c e^{a_0 \frac{\delta_E}{2} + \sum_{k=1}^{N-1} a_k \delta + a_N \delta + \mathcal{O}(\delta^2)}\end{aligned}$$

Get $\rho(E)$ up to a constant with exponential error suppression

$$\rho(E_N) = \rho_c \tilde{\rho}(E_N) e^{\mathcal{O}(\delta^2)}$$

Solve $\Delta E(a) = 0$ via Robbins-Monro iteration

$$a^{(n+1)} = a^{(n)} + \frac{12}{\delta^2(n+1)} \Delta E(a^{(n)})$$

Solve $\Delta E(a) = 0$ via Robbins-Monro iteration

$$a^{(n+1)} = a^{(n)} + \frac{12}{\delta^2(n+1)} \Delta E(a^{(n)})$$

Evaluate $\Delta E(a^{(n)})$ with standard Monte Carlo

$$\begin{aligned}\Delta E(a^{(n)}) &= \langle \langle E - E_0 \rangle \rangle_{\delta}(a^{(n)}) \\ &= \frac{1}{N} \int \mathcal{D}\phi \theta_{E_0, \delta}(E - E_0) e^{-a^{(n)} S}\end{aligned}$$

Solve $\Delta E(a) = 0$ via Robbins-Monro iteration

$$a^{(n+1)} = a^{(n)} + \frac{12}{\delta^2(n+1)} \Delta E(a^{(n)})$$

Evaluate $\Delta E(a^{(n)})$ with standard Monte Carlo

$$\begin{aligned}\Delta E(a^{(n)}) &= \langle \langle E - E_0 \rangle \rangle_{\delta}(a^{(n)}) \\ &= \frac{1}{N} \int \mathcal{D}\phi \theta_{E_0, \delta}(E - E_0) e^{-a^{(n)} S}\end{aligned}$$

New Boltzmann weight!

Solve $\Delta E(a) = 0$ via Robbins-Monro iteration

$$a^{(n+1)} = a^{(n)} + \frac{12}{\delta^2(n+1)} \Delta E(a^{(n)})$$

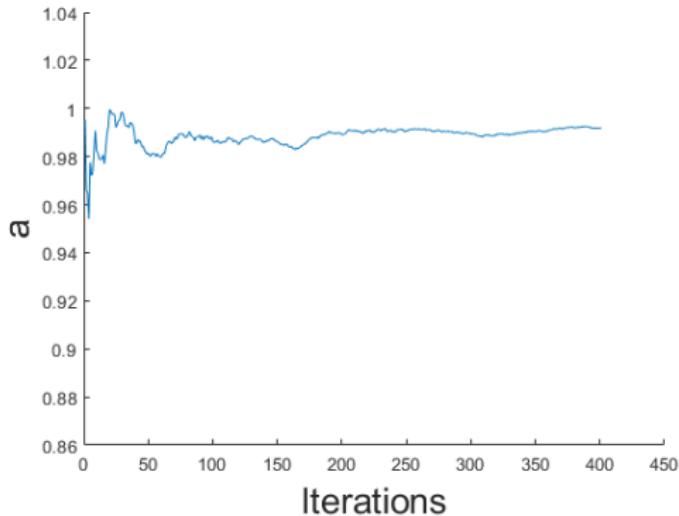

Evaluate $\Delta E(a^{(n)})$ with standard Monte Carlo

$$\begin{aligned}\Delta E(a^{(n)}) &= \langle \langle E - E_0 \rangle \rangle_{\delta}(a^{(n)}) \\ &= \frac{1}{N} \int \mathcal{D}\phi \theta_{E_0, \delta}(E - E_0) e^{-a^{(n)} S}\end{aligned}$$

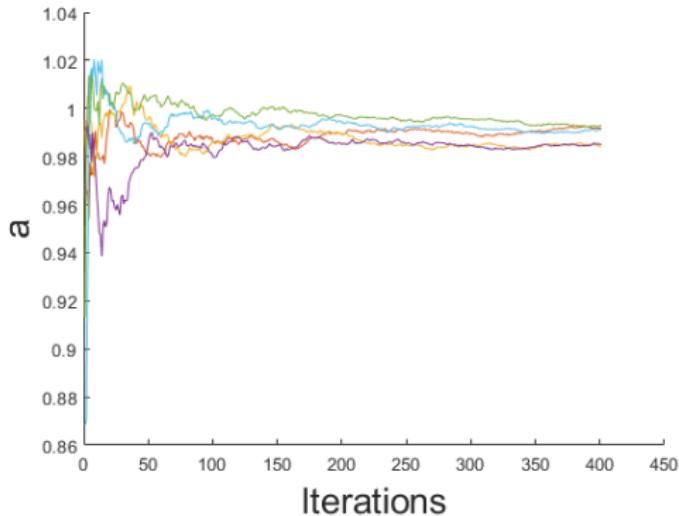

New Boltzmann weight!

Alternatively: $\Delta E(a^{(n)}) = \frac{1}{N} \int \mathcal{D}\phi(E - E_0) e^{-a^{(n)} S - \frac{(S-E_0)}{2\delta^2}}$

Robbins-Monro Iterations

Robbins-Monro Iterations

Pseudocode

loop over energy interval $[E_i \pm \frac{\delta}{2}]$

loop over Robbins-Monro iteration

 loop over Monte Carlo sweeps through the lattice

 Evaluate $\Delta E_i(a_i^{(n)})$ using standard Monte Carlo

 New Boltzmann weight and restricted energy interval!

 End loop

 Calculate new $a_i^{(n+1)}$

$$a_i^{(n+1)} = a_i^{(n)} + \frac{12}{\delta^2(n+1)} \Delta E_i(a_i^{(n)})$$

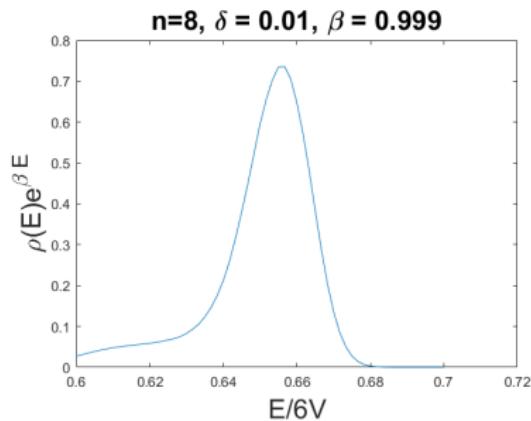

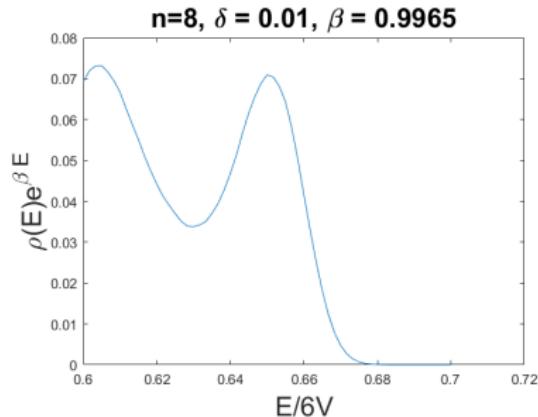

End loop

End loop

Synthetic Data

Synthetic Data

Recap

- ▶ Broad class of Composite Dark Matter models
- ▶ Gravitational waves offer new way to probe these models
- ▶ First order phase transition difficult with MCMC → LLR
- ▶ LLR works for strong bulk phase transitions ($U(1)$, $SU(N)$)
- ▶ Weaker confinement Transition not yet resolved
 - ▶ Improve statistics
 - ▶ Go to bigger lattice sizes and increase aspect ratios
 - ▶ Decrease $\delta = 0.001/V \rightarrow \delta = 0.0001/V$
 - ▶ Go to $SU(N)$ with $N \geq 6$
